

Sarracenia purpurea

Pitcher Plant

A beautiful carnivorous plant. Native to sphagnum bogs, and absolutely requires moist or swampy, acid soil, and sun. Obviously, this is not a plant for general landscape use, but could be a focal point of a carefully planned bog garden. Forms a rosette of leaves, bronze or green veined with red. The margins of each leaf curl up to form a "pitcher" in which rainwater collects and insects are trapped. In May-July, large, nodding, deep red flowers are borne singly on stalks up to 2' long.

Suggested companions: large cranberry (*Vaccinium macrocarpon*), leatherleaf (*Chamaedaphne calyculata*).
